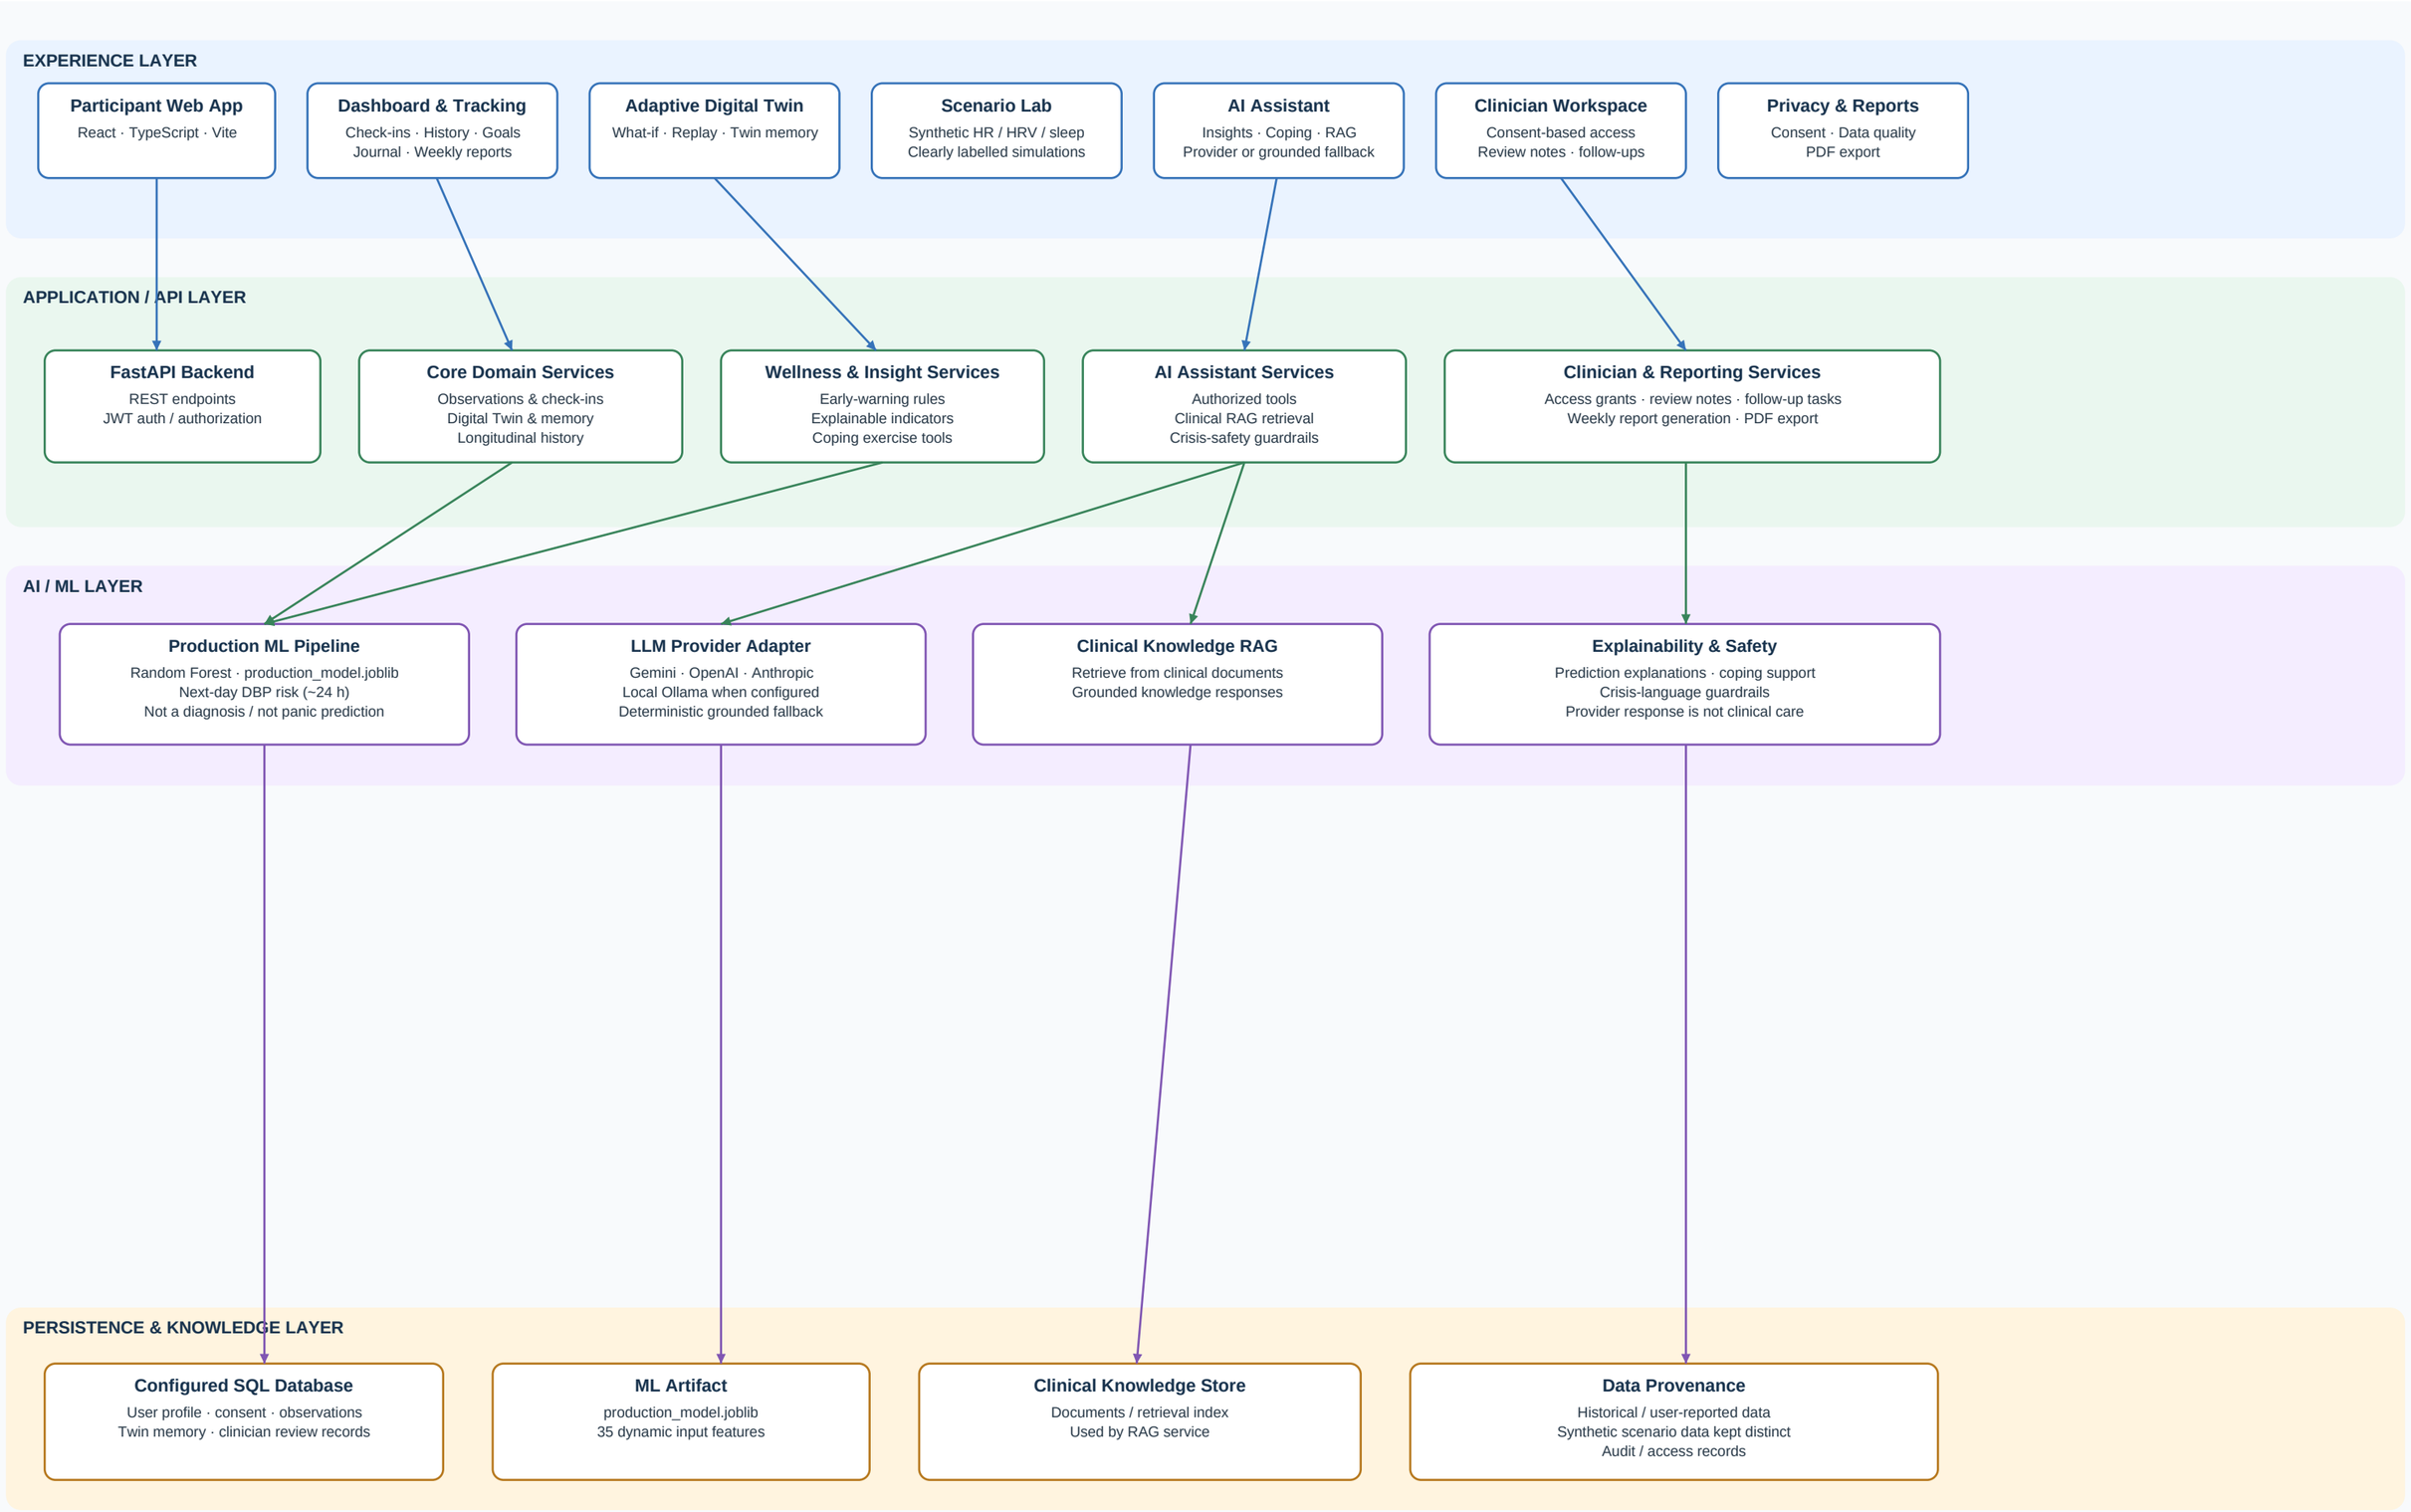
AnxietyTwin — System Architecture

Personalized anxiety monitoring, adaptive digital twin, explainable next-day DBP risk research, and grounded AI assistance



Conceptual architecture based on project details reported so far; confirm exact database, deployment and provider configuration before final submission.

Important scope: the Random Forest estimates next-day DBP risk (approximately 24 hours); it does not diagnose anxiety or predict an imminent panic attack. Synthetic scenario data is kept distinct from historical and user-reported observations. Clinical validity has not been established.
